Passionate about programming. Passionate about games. Passionate about making cool stuff.

Personal Interests

Systems Design - Good game architecture gives me life. I love designing systems as SDK's, exposing the right API for the job and working with other engineers to fulfill their needs with the systems I develop. Good architecture not only keeps things clean but also gives us the opportunity to achieve even greater dreams in the future.

Dev Workflow Tools - I love building dev tools to streamline the gamedev process. I have built many Unity editor tools for work and for my personal projects.

Prototyping - You can never be sure that a game design is good until it's validated. I thrive in an environment where everyone is hungry to find the next coolest thing and discovering the best way to achieve it.

Work

Riot Games – Gameplay, UI, R&D Engineer, *April 2020 – Present*

- **2XKO** *October 2023– Present*

- Shipped!!!
- I am currently the tech lead for UI. I've built most of our core UI architecture that controls all of our menus and transitions throughout the game. I also maintain documentation for our UI systems.
- Worked very closely with our many feature teams to provide the clearest UI foundation for all of our UI needs.
- Wrote many “forever” features like our Universal Camera Manager, the Content Index, and the SublevelLoader. These features solved very technical problems in singular, streamlined, ways which has allowed us to depend on them for years. Consolidating all our relevant practices into these systems has greatly stabilized our project.
- Built many of our menu features including the Main Menu Home Screen, the Avatar Customization Screen, and the Settings Screen.
- I originally joined this team when it was still in R&D but got to see it through to launch.

- **R&D** *May 2022 – October 2023*

- Was a part of various R&D titles in Unreal Engine 5 where I worked with teams to rapidly iterated on experimental games.
- Worked on gameplay, metagame systems, backend services, and lots of UI.

- **Legends of Runeterra** *April 2020 – May 2022*

- Helped build and maintain many of our metagame systems. Most notably I stood up client-side features to support seasonal content.
- Built the card skins/customizations feature which became the biggest revenue source for the game.
- Built an internal in-editor Unity tool to organize, render, and debug the trading cards in our game. This tool saved an immense amount of time for the many developers where were creating cards, being able to instantly visualize the card art placement, localization of text, and card skins without needing to run the game.

PortalsXR – Game/Platform Engineer, *June 2019 – April 2020*

- Lead Unity engineer developing standalone AR mobile apps for IOS and Android.
- Designed core platform architecture for the game systems used in our applications.
- Developed a number of Unity-Editor tools to support development workflows.
- Developed a custom AR framework used for rapid prototyping of AR experiences.

Vertafore – Full Stack Engineer, *February 2018 – June 2019*

- Used Java and RESTful web services for the backend and Javascript/React/Redux for the frontend client.
- Wrote unit tests using Jest and Mockito for Java and Junit and Enzyme for JavaScript.
- SCRUM master for a team size of 8 and adhered to Agile methodologies.
- Lead the implementation of document generation (.docx and .pdf) as a major feature for an automated document generator service.
- Worked closely with product owners, designers, and peers to develop architecture design for newly created services within our project.

Steel Wool Studios – Game Programmer, *September 2016 – February 2018*

- Worked on many VR projects in both Unity and Unreal Engine 4.

Education

University of Southern California
BS: Computer Science (Games)

Graduated August 2016
